**State of the Trails** is a project of the Parks & Trails Council of Minnesota, a statewide non-profit organization dedicated to acquiring, protecting, and enhancing critical land for the public's use and benefit. The *State of the Trails Project* provides detailed data on state trail conditions and examines changes in trail conditions over time. Gathering this information is essential for answering a broad set of policy questions, and provides lawmakers, managers, and the public with the information they need to maintain and enjoy Minnesota's world-class trail system.

Special thanks to the Minnesota Department of Natural Resources for their continued commitment to caring for Minnesota's trails and sharing data for this report.

The Research Bike was made possible by generous support from Erik's Bike Shop.

This report was designed using resources from Freepik.com.

Published June 2019

# Executive Summary

## Key Findings:

See pages 6-31 and Appendix B for details

- Minnesota's paved state trail system is in good condition. Our inventory found 75% of paved state trail miles are in either excellent or good condition.
- Only 32 miles – 6% of the system – are in poor or very poor condition. The remaining 20% of the system – 121 miles – are in fair condition.
- However, conditions declined since our 2016 *State of the Trails Report*. If current trends continue, we project the share of the paved state trail system in excellent or good condition will fall to 70% by 2023 and 50% by 2030.

## Methodology:

See pages 4-5, Appendix A and Appendix C for details

- We rated the surface conditions of Minnesota's paved state trail system using a metric called the "Trail Roughness Index," which measures how smooth or rough a trail is to ride.
- We took approximately 100,000 photos of the paved state trail system to verify ratings and illustrate conditions.
- All of our data was collected using the Research Bike, an electric-assist bicycle equipped with cameras and sensors. In addition to rating trail conditions, we used the Research Bike to put Minnesota's State Trails on Google Street View.

## Recommendations:

See pages 32-35 for details

- Maintain a "25-50-25" surface standard for the state trail system, where the goal is to keep 25% of the system's trail surfaces in excellent condition, 50% in good condition, and the remaining 25% in fair condition.
- Rehabilitate an average of 24 state trail miles per year, which is the pace needed to maintain the state trail system at a "25-50-25" standard.
- Fund state trail rehabilitation at needed levels – approximately \$4.8 million per year, not including bridges and culverts – through a mix of bonding appropriations, Legacy funds, and LCCMR funds.

## Why Trails are Important:

Trails are community assets that make Minnesota a better place to live, work, and visit. Trails connect people and communities to the outdoors, improve health by encouraging physical activity, boost tourism and spending at local businesses, enhance safety, protect ecosystems and wildlife corridors, and are fun for people of all ages, means, and abilities. The *State of the Trails Project* aims to provide trail managers and lawmakers with the data they need to ensure all Minnesotans, both now and in the future, have access to smooth, safe, and enjoyable trails.

# How We Calculate Our Ratings

Our trail condition ratings are based on the premise that trails in excellent condition are smooth to ride and trails in poor condition are rough to ride. We measure how rough each trail is to ride using a metric called the “Trail Roughness Index”, or “TRI” for short. We created the TRI in 2016 as a method to objectively rate the condition of paved bike trails. We updated our methodology in 2018 to improve reliability and validity.

Trail Roughness Index is measured by riding a trail with a device called an accelerometer mounted on the bike’s handle bars. When the bicyclist hits a crack or bump in the trail, the accelerometer measures the force of the jolt felt by the bicyclist. The TRI is a statistical summary of the accelerometer data that indicates the roughness of the ride. Low TRI scores indicate trails in excellent condition (TRI < 30) and high TRI scores indicate trails in very poor condition (TRI > 75).

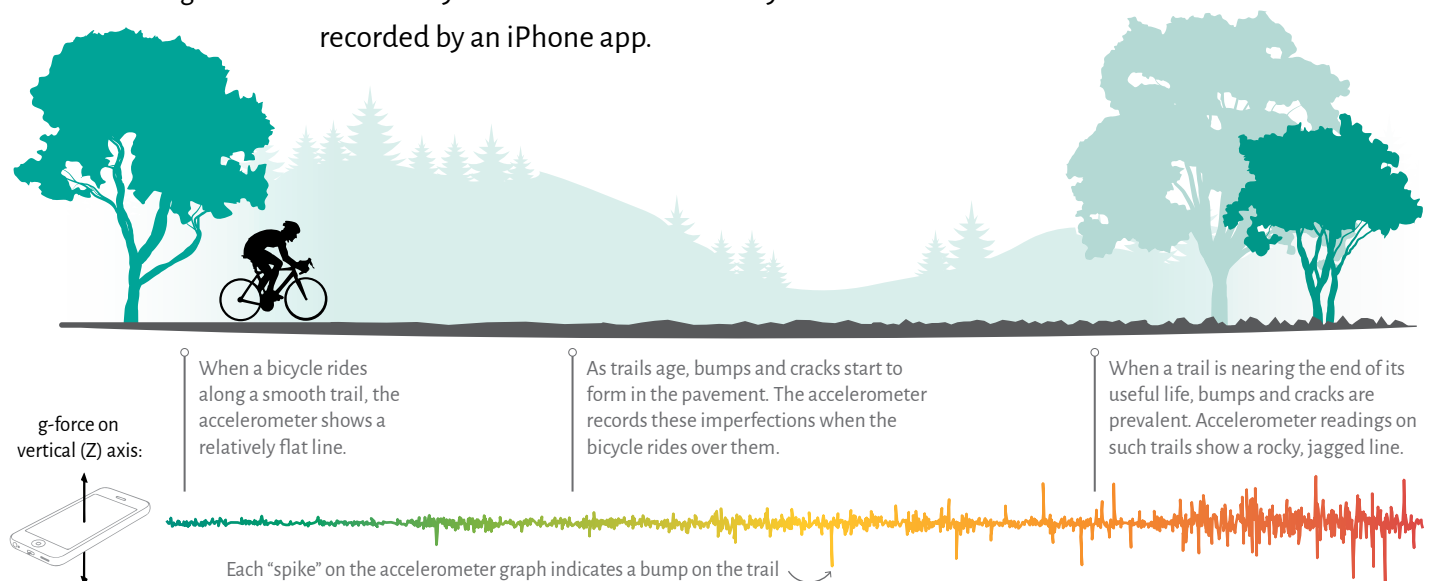

We used TRI scores to rate the condition of Minnesota’s paved state trail system on a segment-by-segment basis. Additionally, we assigned each trail an overall grade using a scale where “excellent” is equal to an “A” and “very poor” is equal to an “F”. The overall trail grade represents the condition of the trail’s average mile.

All of our data was collected by a Parks & Trails Council intern. The intern rode nearly 600 miles of the paved state trail system on the Research Bike, an electric-assist bicycle equipped with cameras and sensors. All data was collected during the summer and fall of 2018.

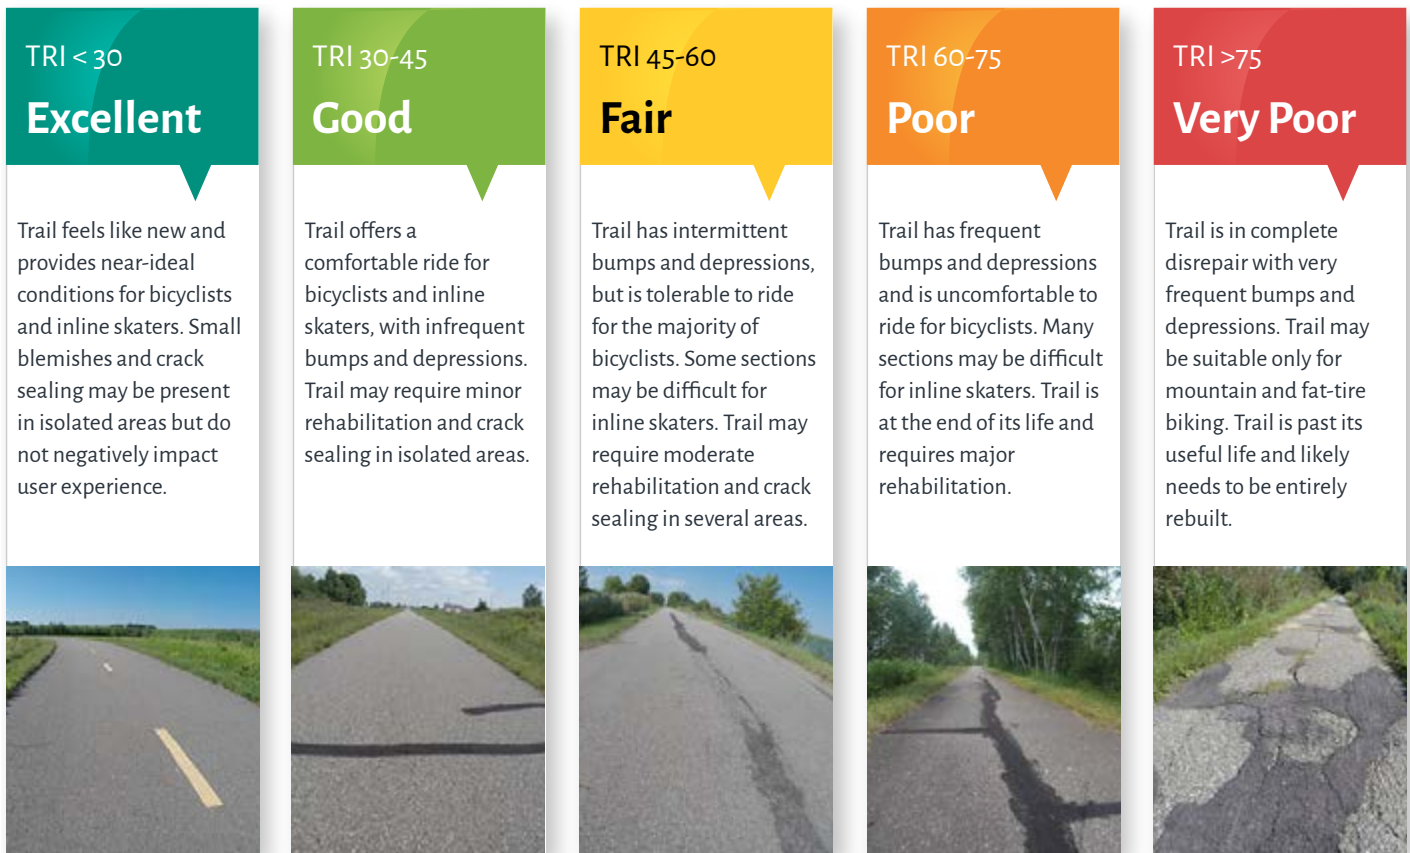

Our TRI scores are supplemented with photos taken during the data collection process. Photos were used to verify condition classifications and are helpful to visualize on-the-ground conditions. See Appendix A and Appendix C for more details on our methodology.

## How the Trail Roughness Index Works

The Trail Roughness Index (TRI) measures the variation in g-forces felt by a bicyclist riding on a trail. The g-force is measured by an accelerometer in a bicycle-mounted iPhone and is recorded by an iPhone app.

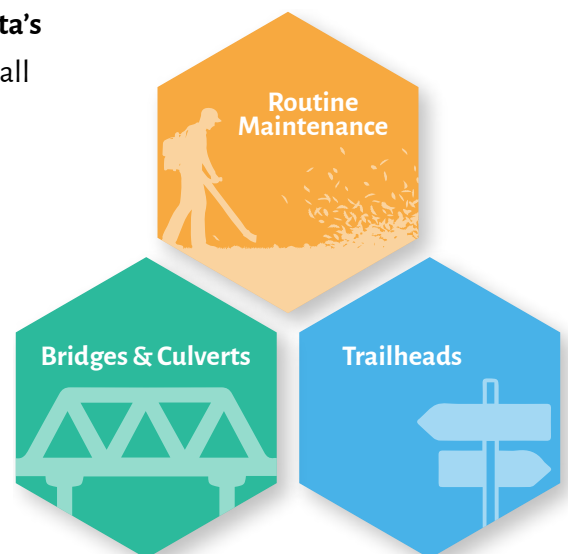

## How to Understand Our Ratings

## What our Ratings Don't Measure

Our ratings only answer a simple question: **How smooth are Minnesota's State Trails to ride?** While we use this question as a proxy for the overall condition of each trail, there are several components of a safe, well-maintained trail system that our ratings don't capture. Our ratings do not consider the integrity of trail bridges, culverts or the underlying trail foundation. Our ratings do not consider the condition of parking areas, interpretive displays or signage. And our ratings only consider day-to-day upkeep to the extent it impacts the smoothness of the ride (e.g., debris on an unswept trail is rougher to ride than a freshly swept trail). See Appendix A for more details on project scope and limitations.

# Key Findings

**Minnesota's paved state trails are still in good condition, but conditions declined since our 2016 report.**

# Minnesota's Aging Trail System

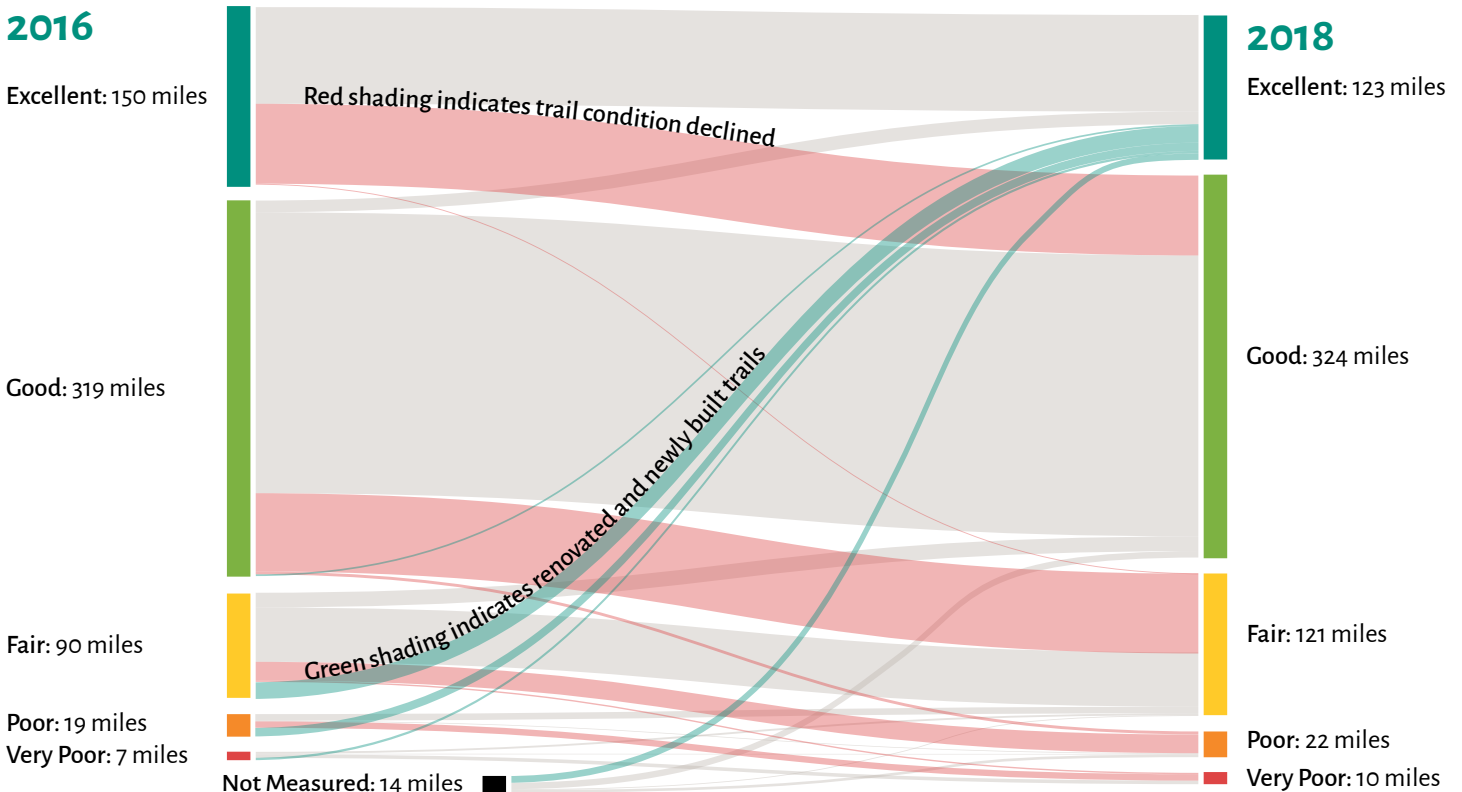

Minnesota's paved state trails are in good condition. But the system is aging and conditions declined since our last *State of the Trails* report. Using our 2016 data as a baseline, and pairing our TRI data with the age of each trail, we can estimate how the paved state trail system will age over the next 10-15 years.

Between 2016 and 2018, the share of the system in excellent or good condition fell from 79% to 75% and the share of the system in poor or worse condition increased from 4% to 6%. These declines are due to trails deteriorating faster than the Minnesota DNR can rehabilitate them. Nearly a quarter of the state trails system – 154 miles – showed worsened conditions from our 2016 report. Twenty-eight miles showed

improved conditions due to repaving. Another 29 miles were shown to be in better condition in 2018 than in 2016. Improvement in these 29 miles is likely due to maintenance. As a note of caution, changes in trail conditions may be due to discrepancies between data collection processes in 2016 and 2018. See Appendix A for details.

The 2016-2018 period is a small sample, but is indicative of an obvious point: trails deteriorate as they age. Our data suggests Minnesota's paved bike trails have an average life-span of 28 years: Newly built trails stay in excellent condition for 7 years on average, are in good condition until they reach the 20-year mark, and are in fair condition until their 28th year. While

## How Trails Conditions Changed Between 2016 and 2018

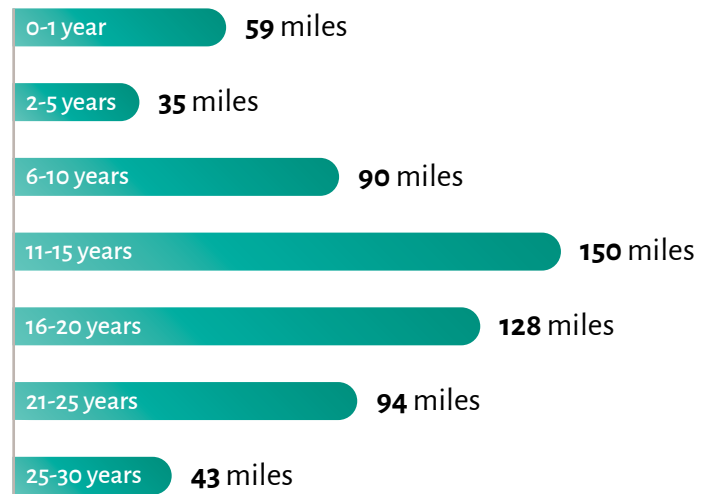

there is significant variation in how different trails age, understanding the average aging cycle is useful for planning purposes. In practice, numerous factors – some controllable (e.g., regular trail upkeep) and others uncontrollable (e.g., severe storms and flooding) – will effect the actual life span of any given trail.

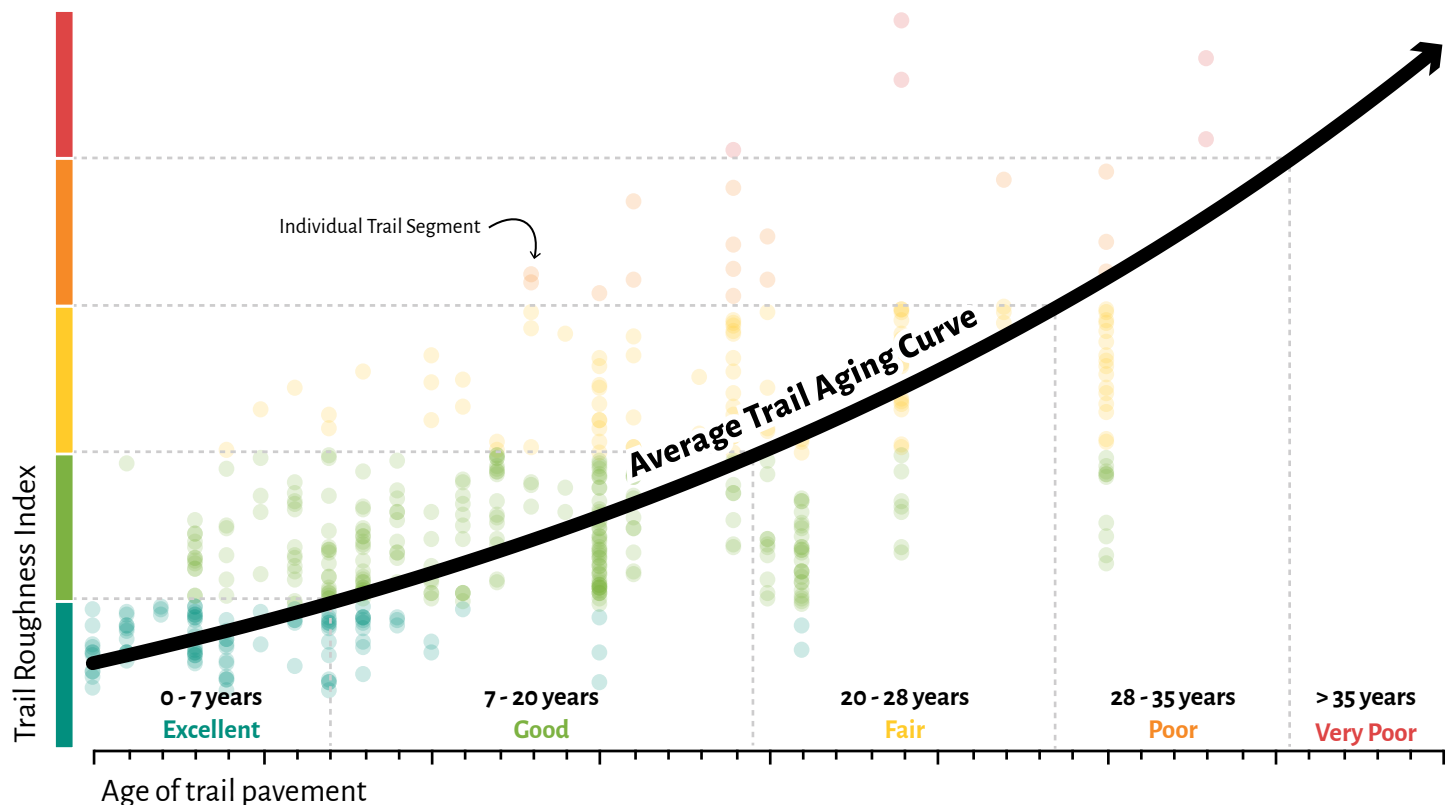

Overall, most paved state trails are near the midway point of their life cycle. We estimate the average state trail mile has 14 years remaining until major repair or replacement is needed. But that doesn't mean there aren't urgent needs. Nearly 60 miles of trail have expected replacement dates by 2020 or sooner. Taking care of these present needs, while also planning for the future, is the challenge facing Minnesota's State Trails.

## Service Life Remaining

*Expected number of years until major rehabilitation or replacement is needed*

## Correlation Between Trail Roughness Index and Trail Age

# Recommendations

Minnesota’s State Trails are at a tipping point. The system remains in overall good condition. But conditions declined since 2016, and that trend will continue unless the pace of trail rehabilitation increases. Relying on our 2018 data, we’ve crafted a set of recommendations to address the challenges facing Minnesota’s state trails.

## Maintain a “25-50-25” Surface Standard

We propose “25-50-25” as a standard for the Minnesota state trail system. At any given time, the goal should be to keep 25% of the system’s trail surfaces in excellent condition, 50% in good condition, and 25% in fair condition. This goal is based loosely on the life-cycle of Minnesota state trails, where a trail is expected to be in good condition for roughly half of its 28-year life.

We offer “25-50-25” as a starting point, and recognize some will find the goal too ambitious and others will think it’s not ambitious enough. The question “How good is good enough” is never an easy one to answer and always involves difficult trade offs. The acceptable

## Proposed Surface Standard

*We suggest “25-50-25” as a goal for Minnesota State Trails*

standard for Minnesota’s state trails may change as conditions change, more data is collected, and additional stakeholders are brought to the table. But in light of existing conditions and political realities, we think 25-50-25 strikes an attainable yet ambitious goal for capital investment planning.

## Rehabilitate 24 Miles Annually

The Minnesota DNR’s current trail rehabilitation goal is to renew 20 miles per year (Division of Parks and Trails Strategic Plan, 2012-2022), a goal that theoretically is sufficient to maintain a 25-50-25 standard over the long-term. Because of current trail conditions, however, and how the system is expected to age over the next decade, our data suggests 24 miles of trail will need to be rehabilitated in the average year to maintain trail surfaces at a 25-50-25 standard.

Rehabilitating 24 miles per year is a significant need and almost twice the number of miles the Minnesota DNR was able to rehabilitate between 2016 and 2018. But if the current pace of rehabilitation – 14 miles per year – continues, we project 70% of the system will be in good or excellent condition by 2023, and only half the system will be in good condition by 2030.

Accelerating the pace of trail rehabilitation to 24 miles per year would reverse the trend of declining conditions and maintain a 25-50-25 standard through 2034 (and beyond). Of note, 24 miles is the *average* annual need over the next 15 years. Precise rehabilitation needs to maintain a 25-50-25 surface standard will vary year-to-year, and it may be more efficient to rehabilitate more than 24 miles in some years and fewer in others. Long

term, however, rehabilitating an average of 24 miles per year is needed to maintain a 25-50-25 standard. Maintaining that pace will require consistent funding from the Minnesota Legislature.

### Fund Trail Rehab at \$4.8 Million Annually

We estimate maintaining a 25-50-25 surface standard will cost approximately \$4.8 million annually. This figure assumes rehabilitating 24 miles annually at an average cost of \$200,000 per mile. Using a baseline cost is necessary for long-term planning even though actual costs fluctuate widely. Our research suggests \$200,000 is a good, conservative estimate that is actually higher than the cost of the recent rehabilitation projects for which data is publicly available.

Trail skeptics will argue spending \$4.8 million on trail rehabilitation annually is outlandish, but the number is well grounded. As of 2012, which is the most recent

year with available data, the sale of bicycles, parts, and accessories generates \$5.3 million annually in state general sales tax (U.S. Census Bureau). And three funding sources already exist that could feasibly cover the cost: state bonding appropriations, the Parks and Trails Legacy Fund, and the Environment and Natural Resources Trust Fund.

Bonding is the traditional method to pay for trail rehabilitation projects, and large bonding bills are typically passed in even-numbered years. Bonding used to be a relatively stable source of funding: The 2008 bill included nearly \$6 million for trail rehabilitation, the 2010 bill included \$4 million, and the 2012 bill included \$4 million split between trail and park rehabilitation. Starting in 2014, rather than receiving a line-item appropriation as it had in prior years, trail rehabilitation was lumped together with all of the DNR's rehabilitation needs in a category called

## Different Scenarios for the Future of Minnesota State Trails

Share of Minnesota's paved state trails in good or excellent condition under different funding scenarios

NOTES: Funding amounts assume trail rehabilitation costs of \$200,000 per mile. Actual costs will vary. Current trend is based on the number of trail miles rehabilitated between 2016 and 2018. Estimates do not include the cost of bridges or new miles being added to the system.

# Recommendations, continued

“natural resources asset preservation,” which received \$10 million in 2014, \$15 million in the 2016-2017 biennium and \$30 million in the 2018-2019 biennium. The question of whether it’s preferable to line-item appropriations or group them into larger categories is a managerial and political one, but we fear state trail rehabilitation gets lost as a small fish in a big pond when included in the larger “asset preservation” category. We’d prefer to see an appropriation specific to trail rehabilitation – in the \$4 to \$6 million range as was done from 2008-2012 – to better provide for the system and improve legislative oversight.

In addition to bonding appropriations, the Parks and Trails Legacy Fund is a significant funding source. The Parks and Trails Legacy Fund was created in 2010 with the passage of the Clean Water, Land and Legacy Amendment in 2008, and is guaranteed until 2034. Currently, the fund receives approximately \$20 million

each year for State Parks and Trails, a small portion of which is used for trail rehabilitation. On average, since 2010, the Parks and Trails Legacy Fund has funded an average of 9 miles of state trail rehabilitation per year (or about \$1.8 million per year).

The final major source of trail funding is the Environment and Natural Resources Trust Fund, which receives lottery proceeds and is appropriated based on recommendations of the Legislative-Citizens Commission on Minnesota Resources (LCCMR). LCCMR currently makes recommendations on how to spend roughly \$50 million annually, and in recent years significant sums have been awarded to the state trail system. Recent LCCMR appropriations to the state trail system have included \$1 million in 2017, \$2.5 million in 2018, and \$5 million in 2019. These funds have been for a mixture of acquisition, development, and rehabilitation projects.

## Funding State Trail Rehabilitation

*Potential funding sources to secure the estimated \$4.8 million per year to maintain a 25-50-25 surface standard*

### LCCMR

LCCMR distributes roughly \$50 million of lottery proceeds each year to environmental projects. LCCMR funding for trail projects has varied, but has been in the \$1 - \$5 million range the last several years.

### Parks & Trails Fund

The Parks & Trails Fund was created in 2010 to supplement traditional funding sources. The fund currently generates roughly \$20 million per year for State Parks and Trails. In most years just under \$2 million of the fund has been used for trail rehabilitation.

### Bonding

Bonding is the traditional method to pay for capital improvement projects. Bonding appropriations for trail rehabilitation have varied wildly, however, including up to \$6 million in some bienniums and nothing in others.

Each of these funding sources have been variable from year to year, and none of them are guaranteed to fund future trail rehabilitation. But there is historical precedent of all three funding state trail rehabilitation in amounts that, taken together, are sufficient to care for the existing state trail system. Importantly, our estimates only include the capital improvement side of the state trail budget; A robust general fund appropriation is also vital for day-to-day upkeep of the state trail system. Further, our estimates do not include the costs of expanding the state system, nor do they include the costs of bridges and trailheads. Bridges, in particular, are a primary factor driving cost fluctuations from mile-to-mile, and are often specifically line-itemed in budget requests and appropriations.

### Capital Improvement Planning

We remain convinced that capital improvement planning is crucial to the long-term health of the state trail system. Capital improvement plans are critical because they provide clarity and allow lawmakers to make informed decisions. For illustrative purposes, we've provided a simple example of what a capital improvement plan might look like. Our sample plan is based solely on TRI scores and doesn't include culverts or bridges. An actual plan would need to include such infrastructure, and would likely also consider additional criteria – such as system plan classification, trail use, and geographical location – when determining priorities. Despite the overt simplicity of our sample plan, we think the benefits of such a priority list are clear: Lawmakers know exactly what they're funding and how that funding is part of a long-term program, and the public knows when to expect their local trail to be repaired.

Our 2018 State of the Trails Report provides compelling evidence that while Minnesota's state trails are in good condition, they are at risk. But the challenges facing the trail system are solvable. Parks & Trails Council is committed to working with trail managers, lawmakers, and the public to ensure we all have a trail system we can be proud of.

### Sample Capital Improvement Plan

*Potential five-year priority list of rehabilitation projects and based on current and projected TRI scores. Does not include the costs of bridges or culverts.*

	Priority Rehabilitation Projects	Miles	Cost Est.
2019	1 Sakatah (#13-15)	5.4	\$1,080
	2 Minnesota Valley (#2-3)	3.0	\$602
	3 Munger (#45)	0.9	\$174
	4 Paul Bunyan (#35-37)	4.7	\$940
	5 Mill Towns (#1-3)	2.9	\$586
	6 Gateway (#1-8)	7.1	\$1,420
2020	7 Munger (#1-7)	11.1	\$2,210
	8 Blazing Star (#4-5)	1.9	\$380
	9 Shooting Star (#14-20)	9.7	\$1,940
2021	10 Paul Bunyan (#39-41)	7.3	\$1,450
	11 Casey Jones (#6-11)	5.7	\$1,140
	12 Munger (#37-39)	6.0	\$1,198
	13 Alex Laveau (#1-6)	5.4	\$1,080
2022	14 Heartland (#36-37)	1.8	\$360
	15 Munger (#11-16)	9.1	\$1,813
	16 Munger (#23-35)	16.0	\$3,196
2023	17 Glacial Lakes (#6-10)	5.7	\$1,134
	18 Paul Bunyan (#31-34)	5.7	\$1,148
	19 Harmony Preston (#2-5)	3.9	\$780
	20 Root River (#29-37)	8.7	\$1,740

NOTES: Priority list is for illustrative purposes only and do not necessarily reflect the official policy or position of any agency or P&TC. Cost estimates based on \$200,000 per mile. Actual costs will vary. All costs in \$1,000s. Trails reference segment numbers assigned by P&TC; See Appendix B for descriptions.

## Detailed Methodology

### Project Scope

We limited this project to paved trails that are authorized under Minnesota Statute 85.015. While we often refer to such trails as “state trails”, they are actually only a small portion of the state trail system at large. Overall, the Minnesota DNR manages more than 1,500 miles of state trails; 4,100 miles of hiking, biking, and motorized trails in state parks, state recreation areas, and state forests; and 22,000 miles of snowmobile trails.

We excluded several paved trail segments from our analysis that are authorized under Minnesota Statute 85.015 but not owned and managed by the Minnesota DNR. These segments, which total approximately 20 miles, include the Minnesota River Trail, the Taconite Trail, the Wagon Wheel Trail, and intracity sections of the Cuyuna Lakes Trail. Additionally, a short segment of the Minnesota Valley State Trail located within Fort Snelling State Park wasn't included in our analysis.

### Data Collection

All of the data was collected by a Parks & Trails Council intern using the Research Bike, an electric-assist bicycle equipped with cameras and sensors (see Appendix C). Data was collected between July 23, 2018 and September 25, 2018.

An accelerometer in an iPhone SE mounted to the Research Bike's handle bars collected the data used to calculate Trail Roughness Index (TRI) scores. Accelerometer data, along with location data and speed, was collected twice per second using the SensorLog app. In total we collected 526,071 accelerometer data points used for analysis.

Additionally, a rear-facing GoPro camera took photos every two seconds (approximately every 45 feet). A total of 65,834 photos were taken. Links to these photos are provided in Appendix B and through an interactive map on our website.

Data was collected riding in both directions on each trail. Due to equipment malfunctions, data was only collected traveling in one direction for 12 of the 599 miles we surveyed.

### Data Analysis

All of the data was analyzed on a segment-by-segment basis. Trail segments were demarcated using road intersections, keeping the length of each segment to as close to one mile as possible. In total, we rated the condition of 460 segments with an average length of 1.3 miles (*Mdn* = 1.1; *Max* = 4.9; *Min* = 0.45).

Trail condition ratings are based on TRI scores. TRI is equal to the standard deviation of the g-force felt along the vertical (Z) axis of the Research Bike while riding a given trail segment (excluding road intersections and wood-decked bridges), multiplied by 100 for scale, and adjusted for speed. TRI break points between rating categories were determined by analyzing trail photos.

TRI scores from our 2016 report are not directly comparable to 2018 scores because of changes in methodology. The 2016 data was collected by different volunteers using different bikes, and then adjusted to control for the differences, whereas our 2018 data was all collected using the Research Bike. Despite the TRI scale being different between our 2016 and 2018 data, the condition ratings remain comparable. When we say

a trail is in “good” condition, for example, we mean the same thing in 2018 as we did in 2016. We did, however, further differentiate the “poor” category into “poor” and “very poor” for our 2018/2019 report.

### Speed Adjustment

Controlling for speed is important to ensure TRI scores are comparable across data samples. We attempted to maintain a consistent speed throughout the data collection process, but the lack of a speed control mechanism on the Research Bike made speed fluctuations unavoidable. Across all of our samples (n=942), the average speed was 7.1 meters per second (*Mdn* = 7.0, *SD* = 0.07). We calculated a simple adjustment factor to control for this variation by analyzing 455 paired samples for the effect of average speed on TRI. On average, increasing speed one meter per second increased TRI by 3 points ( $R^2 = 0.07$ ,  $p < .001$ ). All of our TRI scores are adjusted to estimate an average speed of 7 meters per second (15.7 mph).

### Margin of Error

TRI scores from different samples collected on the same segment often vary for numerous reasons: different lines taken by the bicycle, error associated with the speed adjustment, and random noise associated with vibrations in the bicycle frame and rider movements. We estimate our TRI scores have an average margin of error of +/- 6.1 points, which is acceptable. Confidence intervals for each segment are reported in Appendix B.

### Photo Verification

In many cases (n=201), different samples from the same segment had TRI scores indicative of different

condition ratings. In these cases, trail photos were used to verify TRI scores. For the majority of these segments (n=155), the average of TRI scores resulted in the correct condition classification. For the remaining segments (n=46), one TRI score was chosen over another based on staff assessment of trail photos.

### Limitations

The TRI only measures the smoothness of the path taken by the bicycle, and as such likely underestimates the overall condition of trails with easily avoidable bumps and cracks (i.e. those forming along pavement edges or longitudinally down the center). Conversely, the TRI likely overestimates the condition of trails with excess debris due to its setting, time of year, recent storm activity, or infrequent sweeping.

Additionally, the TRI is a summary statistic for a given segment of trail. Over the course of a mile, a trail may be in excellent condition for one stretch and in poor condition for another. Consequently, segments we have rated as excellent or good may have stretches of poor pavement. And stretches we have rated as poor may have stretches of good pavement.

Despite these limitations, the TRI is an objective measurement of trail smoothness based on a replicable methodology and verified with photos. Our intention is that TRI scores supplement, rather than replace, professional trail assessments conducted on the ground by trained engineers.

# About the Research Bike

All the data in the 2018/2019 State of the Trails Report was collected by the **research bike**, a Stromer ST2 electric-assist bicycle equipped with sensors and multiple cameras to collect data on trail conditions. The Research Bike logged 1,355 trail miles between July and September of 2018 and collected three types of data: 39,726 panoramic photos published on Google Map's Street View app; a comprehensive database of 65,834 trail condition photos available on our website; and 532,912 accelerometer data points that indicate how rough (or smooth) each mile of state trail is to ride.

**1**

An Insta360 One camera mounted above the rider's head takes 360° photos for Google Street View.

**2**

A rear-facing GoPro Hero 5 camera takes up-close, geo-located photos of trail conditions.

**3**

The SensorLog app on an iPhone SE records accelerometer data used to rate trail roughness.
